

MagicCode Super-Resolution Software Migration Guide

Document Version: v1.2.0

1. Purpose

This guide helps customers migrate from MagicCode Super-Resolution Software v1.1 to v1.2.0.

2. Main Migration Changes

Area
v1.1
v1.2.0
Action

Scaling

Public range is 1.0x to 8.0x, with backend and model limits.

Same public range. CPU documents (1,2), exact 2.0, and (2,8] more clearly. Combined bins cover multiple scales and sharpen grades.

Validate requested scales and model availability.

Modes

Public API used HIGH_SPEED_MODE and SPEED_MODE.

Public API uses SPEED_MODE (0) and BALANCED_MODE (1). Numeric values are unchanged.

Rename HIGH_SPEED_MODE to SPEED_MODE and SPEED_MODE to BALANCED_MODE in UI, config, and wrappers.

Backend

Less explicit backend coverage.

Backend selector includes x86, NEON, Metal, OpenGL, OpenGLES, Vulkan, Direct3D 11, and default.

Set backend explicitly where needed.

Input Type

Input type is explicit and must match CPU/GPU backend.

CPU also supports INPUT_BUFFER_RGB (planar RGB). INPUT_BUFFER_R8 is an alias of INPUT_BUFFER.

Set input_type correctly.

Reporting

Fewer technical fields.

Additional report reason and processing statistics are reported.

Review Privacy Policy and Data Reporting Notice.

Plugins

Plugin support was less formal.

Unity and Unreal Engine integration guides and validation workflows are included.

Use v1.2.0 plugin docs and rebuild plugin artifacts.

3. Native Code Migration

1Replace the header with v1.2.0 mc_interface.h (and mc_enable.h if using Enable).

2Rebuild against v1.2.0 libraries.

3Populate input_param_t fields including input_type, log_level, backend, and sharpen_level.

4Rename HIGH_SPEED_MODE to SPEED_MODE and SPEED_MODE to BALANCED_MODE. Keep numeric 0/1.

5Prefer combined models magic_sr_gpu_params.bin and magic_sr_cpu_params.bin when available.

6 Use MC_Control(QUERY_STATUS) to verify output dimensions and runtime status.

4. Unity Migration

- Replace old native plugin binaries with v1.2.0 plugin artifacts.

- Update C# wrappers to v1.2.0. HighSpeed maps to Speed; Speed maps to Balanced.

- Use CreateEx where explicit input type and backend selection are required.

- Validate Android and iOS builds on physical devices.

5. Unreal Engine Migration

- Replace the MagicSR plugin folder with the v1.2.0 plugin.
 - Verify native library paths in module rules.
- Update Blueprint usage to the v1.2.0 exposed API.
 - Validate package/install/run workflow for each target platform.

6. Documentation Migration

- Replace old EULA and Privacy Policy with the current versions. Filenames no longer include a version suffix.
 - Review the updated Software Specification, Error Code Manual, Data Reporting Notice, and Release Notes.
 - If your product redistributes MagicCode, update your own customer-facing privacy and license notices as needed.

7. Final Acceptance Checklist

- Version query returns v1.2.0.
 - All target modes and scales pass validation.
 - All target backends pass validation or are disabled in product configuration.
 - Model files are packaged correctly.
 - Technical reporting disclosure has been reviewed.
 - Known issues and release notes are reviewed by integration and support teams.
